MOBILE APPLICATION DEVELOPMENT · PROJECT

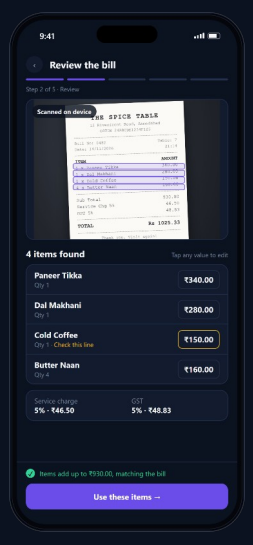

Split the bill. Fairly.

Divvy — intelligent, receipt-based bill splitting for iPhone and Android

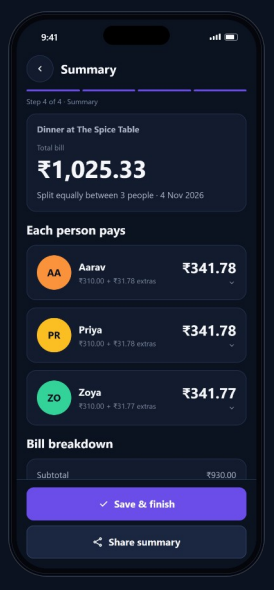

Photograph a receipt, add the people, and see exactly what everyone owes — to the paisa.

01 The problem

- Totals worked out by hand, at the table
- Equal splits ignore who ordered what
- GST on the service charge is guessed
- Rounding each share creates or loses paise

By hand ₹1,025.33 ÷ 3 → 3 × ₹341.78 = ₹1,025.34

02 Receipt-first solution

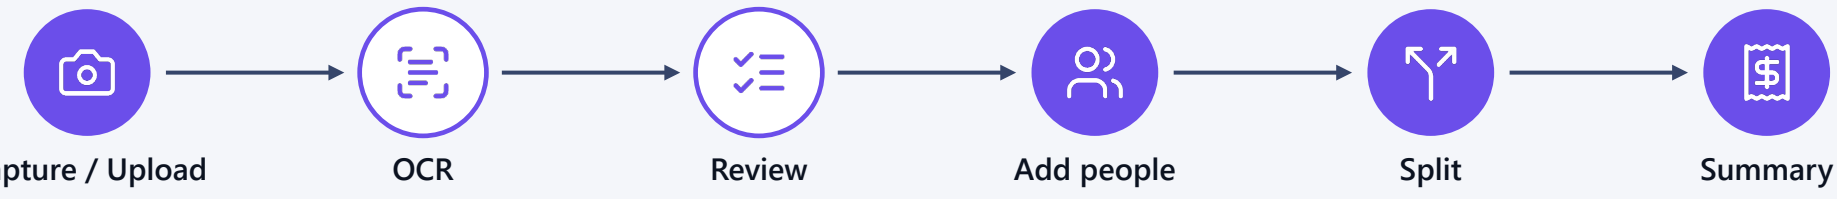

Photograph the bill. Divvy reads it, you confirm it and assign items; service and GST are shared in proportion.

AA Aarav	₹349.15
PR Priya	₹349.12
ZO Zoya	₹327.06

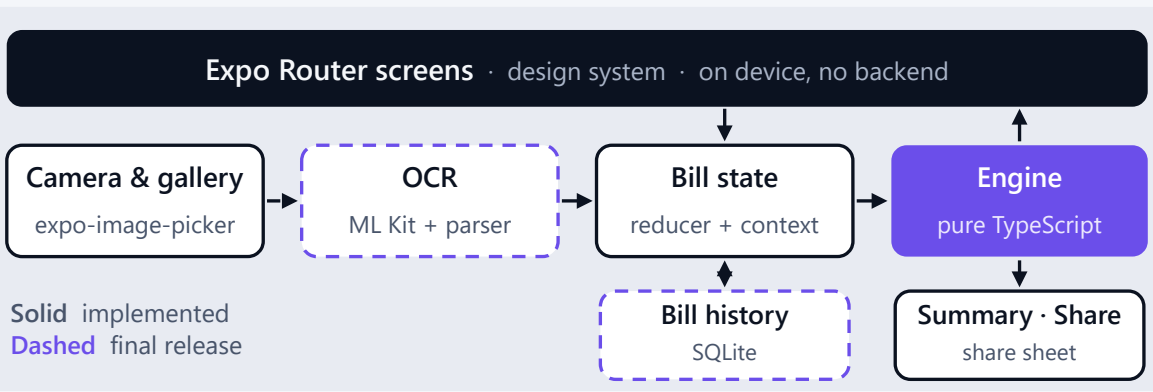

Σ ₹1,025.33 exactly the bill

03 Application workflow

Implemented · Final release

04 System architecture

05 Technology stack

- React Native 0.88
- Expo SDK 58
- TypeScript
- Expo Router
- expo-image-picker
- React 19
- Jest · 274 tests
- ESLint · Prettier
- ML Kit OCR (final release)
- SQLite (final release)

06 Features and USP

Receipt-first	Less typing	Transparent	Exact money	Indian bills	Private
Photo starts the bill	OCR pre-fills items	Every share explained	Σ shares = total	GST on service charge	On device, no account

Conclusion Divvy makes splitting a bill fast, fair and verifiable: a receipt-first workflow on a money engine that is exact by construction.
